

WSL 2 + Docker + Dorarion

Simple local installation guide

Goal: Install Ubuntu in WSL 2, install Docker, clone Dorarion, generate its required secrets, create the first administrator, and open Dorarion in your Windows browser.

- Run Windows commands in PowerShell as Administrator.
- Run Linux and Docker commands inside the Ubuntu WSL terminal.
- This guide follows the Dorarion Compose workflow used successfully on the local machine.

1. Install WSL 2 and Ubuntu

Open PowerShell as Administrator and run:

```
wsl --install -d Ubuntu
```

Restart Windows if asked. Then open Ubuntu from the Start menu and create your Linux username and password.

Optional check from PowerShell:

```
wsl -l -v
```

Ubuntu should show VERSION 2.

2. Prepare Ubuntu

```
sudo apt update
sudo apt upgrade -y
sudo apt install -y git openssl ca-certificates curl
```

3. Install Docker Engine and Compose

3.1 Remove old/conflicting Docker packages

```
sudo apt remove -y docker.io docker-compose docker-compose-v2 \
docker-doc docker-buildx podman-docker containerd runc
```

3.2 Add Docker's official repository

```
sudo apt update
sudo apt install -y ca-certificates curl
sudo install -m 0755 -d /etc/apt/keyrings
sudo curl -fsSL https://download.docker.com/linux/ubuntu/gpg \
-o /etc/apt/keyrings/docker.asc
sudo chmod a+r /etc/apt/keyrings/docker.asc

sudo tee /etc/apt/sources.list.d/docker.sources <<EOF
Types: deb
URIs: https://download.docker.com/linux/ubuntu
Suites: $(. /etc/os-release && echo "${UBUNTU_CODENAME:-$VERSION_CODENAME}")
Components: stable
Architectures: $(dpkg --print-architecture)
Signed-By: /etc/apt/keyrings/docker.asc
EOF

sudo apt update
```

3.3 Install and test Docker

```
sudo apt install -y docker-ce docker-ce-cli containerd.io \
  docker-buildx-plugin docker-compose-plugin

sudo docker run --rm hello-world
docker --version
docker compose version
```

Simple option: The commands below use sudo with Docker. That is fine for this local installation and avoids Docker socket permission problems.

4. Download Dorarion

```
mkdir -p ~/projects
cd ~/projects
git clone https://github.com/dorarion/dorarion-compose.git
cd dorarion-compose
```

5. Prepare Dorarion

Run Dorarion's Compose installer once. It prepares the Compose environment, including `.env.docker`:

```
./scripts/install-compose.sh
```

Check the environment file:

```
cat .env.docker
```

If `.env.docker` is owned by root: Only if you get a permission error while editing the file, run: `sudo chown "$USER:$USER" .env.docker`

6. Generate Dorarion secrets

Run these commands in the `dorarion-compose` directory:

```
POSTGRES_PASSWORD="$(openssl rand -hex 32)"
JWT_SECRET="$(openssl rand -hex 32)"
SECRET_ENCRYPTION_KEY="$(openssl rand -base64 32)"

sed -i "s|^POSTGRES_PASSWORD=.*|POSTGRES_PASSWORD=$POSTGRES_PASSWORD|" .env.docker
sed -i "s|^JWT_SECRET=.*|JWT_SECRET=$JWT_SECRET|" .env.docker
sed -i "s|^SECRET_ENCRYPTION_KEY=.*|SECRET_ENCRYPTION_KEY=$SECRET_ENCRYPTION_KEY|" .env.docker
```

Make sure no placeholder values remain:

```
grep 'replace-' .env.docker
```

Expected result: no output.

Keep `.env.docker` private: It contains database and application secrets. Do not post it in chat, screenshots, tickets, or Git commits.

7. Start Dorarion

```
sudo ./scripts/install-compose.sh
sudo docker compose --env-file .env.docker ps
```

If the services are running, continue to the administrator setup.

8. Generate the first Dorarion administrator secret

Create the first local administrator with username admin and email admin@example.com:

```
cd ~/projects/dorarion-compose
sudo docker compose --env-file .env.docker run --rm dorarion \
  bootstrap-admin admin admin@example.com
```

Save the generated admin secret/password: The bootstrap command generates or prints the credential needed for the administrator account. Copy it to a password manager immediately. You will use it on the login page.

The login values are:

Field	Value
Username	admin
Email	admin@example.com
Password	The generated bootstrap admin secret/password

9. Open Dorarion

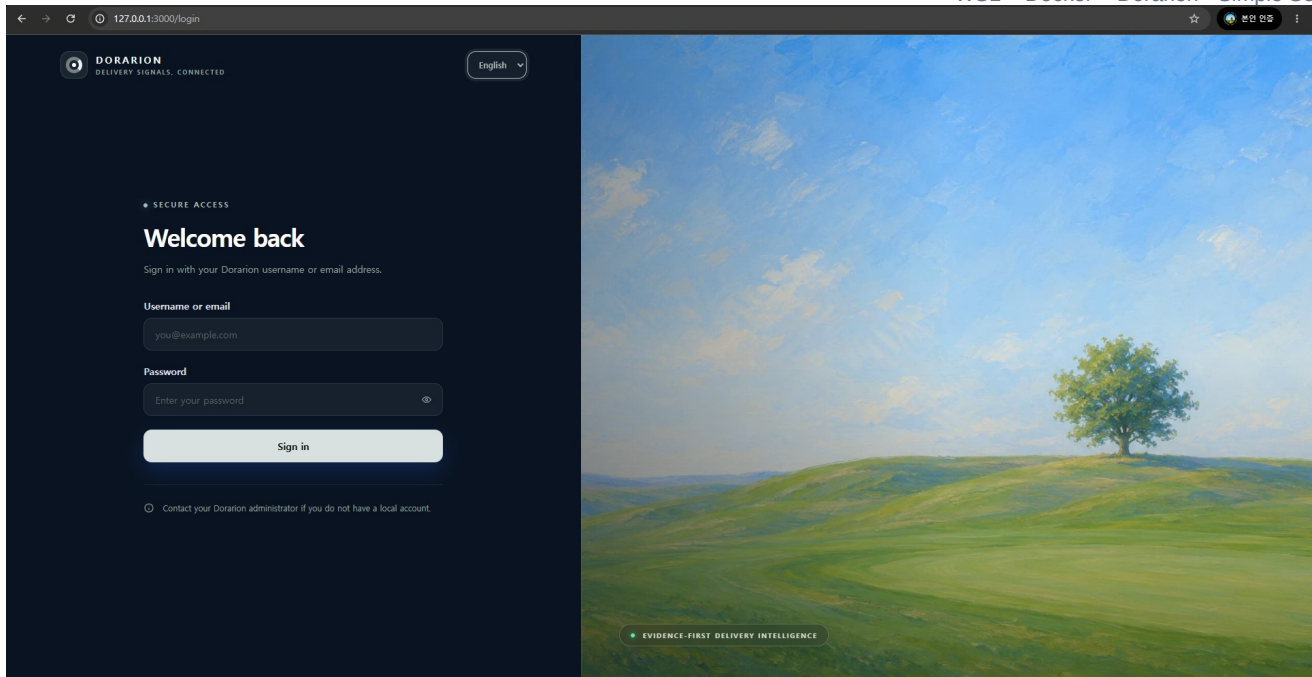

On Windows, open Chrome, Edge, or another browser and go to:

```
http://127.0.0.1:3000/login
```

You can also try:

```
http://localhost:3000/login
```

Sign in with admin (or admin@example.com) and the generated administrator password/secret from Step 8.

Dorarion login page at 127.0.0.1:3000/login

10. Useful checks

```
sudo docker compose --env-file .env.docker ps
sudo docker compose --env-file .env.docker logs --tail=100
```

If Dorarion is not opening, first confirm that the containers are Up and that port 3000 is published.

Quick recap

- WSL 2 + Ubuntu installed.
- Docker Engine + Docker Compose installed.
- dorarion-compose cloned into ~/projects/dorarion-compose.
- .env.docker secrets generated.
- Dorarion services started.
- First admin generated with bootstrap-admin.
- Dorarion opened at <http://127.0.0.1:3000/login>.
